

METHOD, SYSTEM, AND STORAGE MEDIUM FOR VALIDATING USERS OF COMMUNICATIONS SERVICES AND MESSAGES TRANSMITTED

ABSTRACT

[0034] Exemplary embodiments of the invention relate to a method, system, and storage medium for validating users of communications services. The method includes generating records for communications service users by at least one service provider. The records store information relating to the communications service users including legal liability information, an originator type code, and a validation code assigned to selected originator type codes. The validation code facilitates validation of the communications service users. The method also includes storing the records in a subscriber classification database. The originator type code classifies the communications service users according to nature of use, communications type, business type, geography, and age.
